Abstract—This paper studies channel coding for the discrete memoryless multiple-access channel with a given decoding rule. A multi-letter successive decoding rule depending on an arbitrary non-negative function $q(x_1, x_2, y)$ is considered, and an achievable rate region and error exponent are derived. The rate region is compared with that of the maximum-metric decoder which uses the function $q(x_1, x_2, y)$, and a numerical example is given for which successive decoding yields a strictly higher sum rate for a given pair of input distributions.

I. INTRODUCTION

The mismatched decoding problem [1]–[3] seeks to characterize the performance of channel coding when the decoding rule is fixed and possibly suboptimal (e.g. due to channel uncertainty or implementation constraints). Extensions of this problem to multiuser settings are not only of interest in their own right, but can also provide valuable insight into the single-user setting [3]–[5]. In particular, significant attention has been paid to the mismatched multiple-access channel (MAC), for which, given the length- n output vector $\mathbf{y}$ and codebooks $\mathcal{C}_\nu = \{\mathbf{x}_\nu^{(1)}, \dots, \mathbf{x}_\nu^{(M_\nu)}\}$ ($\nu = 1, 2$), the decoder estimates the message pair as

$$(\hat{m}_1, \hat{m}_2) = \arg \max_{(i,j)} q^n(\mathbf{x}_1^{(i)}, \mathbf{x}_2^{(j)}, \mathbf{y}), \quad (1)$$

where $q^n(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y}) \triangleq \prod_{i=1}^n q(x_{1,i}, x_{2,i}, y_i)$ for some non-negative decoding metric $q(x_1, x_2, y)$.

Given that the decoder only knows the metric $q^n(\mathbf{x}_1^{(i)}, \mathbf{x}_2^{(j)}, \mathbf{y})$ corresponding to each codeword pair, one may question whether there exists a decoding rule with better performance than the maximum-metric rule in (1). In general, this question is only interesting if “reasonable” decoding rules are considered. For example, if the values $\{\log q(x_1, x_2, y)\}$ are rationally independent (i.e. no value can be written as linear combinations of the others with rational coefficients), then there is a one-to-one correspondence between the joint empirical distribution of $(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y})$ and the possible values of $q^n(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y})$, and hence the decoder can implement the maximum-likelihood (ML) rule (assuming the channel is memoryless).

This work has been funded in part by the European Research Council under ERC grant agreement 259663, by the European Union’s 7th Framework Programme (PEOPLE-2011-CIG) under grant agreement 303633 and by the Spanish Ministry of Economy and Competitiveness under grants RYC-2011-08150 and TEC2012-38800-C03-03.

In this paper, we consider successive decoding of the form

$$\hat{m}_1 = \arg \max_i \sum_j q^n(\mathbf{x}_1^{(i)}, \mathbf{x}_2^{(j)}, \mathbf{y}) \quad (2)$$

$$\hat{m}_2 = \arg \max_j q^n(\mathbf{x}_1^{(\hat{m}_1)}, \mathbf{x}_2^{(j)}, \mathbf{y}). \quad (3)$$

Stated formally, we have the following. Let $W(y|x_1, x_2)$ be the transition law of a memoryless MAC, and let $q(x_1, x_2, y)$ be an arbitrary non-negative function. The alphabets are denoted by $\mathcal{X}_1$, $\mathcal{X}_2$ and $\mathcal{Y}$, and each is assumed to be finite. Encoder $\nu = 1, 2$ takes as input m_ν equiprobable on $\{1, \dots, M_\nu\}$, and transmits the corresponding codeword $\mathbf{x}_\nu^{(m_\nu)}$ from a codebook $\mathcal{C}_\nu$. We say that a rate pair (R_1, R_2) is achievable if, for all $\delta > 0$, there exist sequences of codebooks $\mathcal{C}_{1,n}$ and $\mathcal{C}_{2,n}$ with $M_1 \geq e^{n(R_1-\delta)}$ and $M_2 \geq e^{n(R_2-\delta)}$ respectively, such that $\mathbb{P}[(\hat{m}_1, \hat{m}_2) \neq (m_1, m_2)] \rightarrow 0$ under the decoding rule described by (2)–(3).

Letting $\mathcal{E}_\nu \triangleq \{\hat{m}_\nu \neq m_\nu\}$ for $\nu = 1, 2$, we observe that if $q(x_1, x_2, y) = W(y|x_1, x_2)$, then (2) is the decision rule which minimizes $\mathbb{P}[\mathcal{E}_1]$. That is, (2) is a mismatched version of the optimal decoding rule for (one user of) the interference channel (IC). Thus, as well as giving an achievable rate region for the MAC with mismatched successive decoding, our results will quantify the loss due to mismatch for the IC. In particular, we obtain an achievable error exponent using different techniques to those of [6].

It can be shown that the exponents and rates with $q = W$ coincide with those of ML decoding (i.e. (1) with $q = W$); this is done by noting that (2) minimizes $\mathbb{P}[\mathcal{E}_1]$, (3) minimizes the probability of favoring some (m_1, j) ($j \neq m_2$) over (m_1, m_2) , and (1) minimizes $\mathbb{P}[\mathcal{E}_1 \cup \mathcal{E}_2]$. In contrast, we will see that when $q \neq W$, the successive decoder can lead to significantly different rate regions to those of maximum-metric decoding.

Notation: Bold symbols are used for vectors (e.g. $\mathbf{x}$), and the corresponding i -th entry is written using a subscript (e.g. x_i). Subscripts are used to denote the distributions corresponding to expectations and mutual informations (e.g. $\mathbb{E}_P[\cdot]$, $I_P(X; Y)$). The marginals of a joint distribution P_{XY} are denoted by P_X and P_Y . We write $P_X = \tilde{P}_X$ to denote element-wise equality between two probability distributions on the same alphabet. The set of all sequences of length n with a given empirical distribution P_X (i.e. type [7, Ch. 2]) is denoted by $T^n(P_X)$. We write $f(n) \doteq g(n)$ if $\lim_{n \rightarrow \infty} \frac{1}{n} \log \frac{f(n)}{g(n)} = 0$.

0, and similarly for $\leq$ and $\geq$. We write $[\alpha]^+ = \max(0, \alpha)$, and denote the indicator function by $\mathbb{1}\{\cdot\}$

II. MAIN RESULT

We fix the input distributions Q_1 and Q_2 , let $P_{X_1 X_2 Y} \triangleq Q_1 \times Q_2 \times W$, and define the functions

$$\begin{aligned} \bar{F}(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}, R_2) &\triangleq \max \left\{ \mathbb{E}_{\tilde{P}}[\log q(X_1, X_2, Y)], \right. \\ &\quad \left. \mathbb{E}_{\tilde{P}'}[\log q(X_1, X_2, Y)] + [R_2 - I_{\tilde{P}'}(X_2; X_1, Y)]^+ \right\}, \end{aligned} \quad (4)$$

$$\begin{aligned} \underline{F}(P_{X_1 X_2 Y}, R_2) &\triangleq \max \left\{ \mathbb{E}_P[\log q(X_1, X_2, Y)], \right. \\ &\quad \max_{P'_{X_1 X_2 Y} \in \mathcal{T}'_1(P_{X_1 X_2 Y}, R_2)} \mathbb{E}_{P'}[\log q(X_1, X_2, Y)] \\ &\quad \left. + R_2 - I_{P'}(X_2; X_1, Y) \right\}, \end{aligned} \quad (5)$$

and the sets

$$\begin{aligned} \mathcal{T}_1(P_{X_1 X_2 Y}, R_2) &\triangleq \left\{ (\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) : \tilde{P}_{X_2 Y} = P_{X_2 Y}, \right. \\ &\quad \tilde{P}_{X_1} = P_{X_1}, \tilde{P}'_{X_1 Y} = \tilde{P}_{X_1 Y}, P'_{X_2} = P_{X_2}, \\ &\quad \left. \bar{F}(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}, R_2) \geq \underline{F}(P_{X_1 X_2 Y}, R_2) \right\} \end{aligned} \quad (6)$$

$$\begin{aligned} \mathcal{T}'_1(P_{X_1 X_2 Y}, R_2) &\triangleq \left\{ P'_{X_1 X_2 Y} : \right. \\ &\quad \left. P'_{X_1 Y} = P_{X_1 Y}, P'_{X_2} = P_{X_2}, I_{P'}(X_2; X_1, Y) \leq R_2 \right\} \end{aligned} \quad (7)$$

$$\begin{aligned} \mathcal{T}_2(P_{X_1 X_2 Y}) &\triangleq \left\{ \tilde{P}_{X_1 X_2 Y} : \tilde{P}_{X_2} = P_{X_2}, \tilde{P}_{X_1 Y} = P_{X_1 Y}, \right. \\ &\quad \left. \mathbb{E}_{\tilde{P}}[\log q(X_1, X_2, Y)] \geq \mathbb{E}_P[\log q(X_1, X_2, Y)] \right\}. \end{aligned} \quad (8)$$

Theorem 1. For any input distributions Q_1 and Q_2 , the pair (R_1, R_2) is achievable for the decoder in (2)–(3) provided that

$$\begin{aligned} R_1 &\leq \min_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1(P_{X_1 X_2 Y}, R_2)} I_{\tilde{P}}(X_1; X_2, Y) \\ &\quad + [I_{\tilde{P}'}(X_2; X_1, Y) - R_2]^+ \end{aligned} \quad (9)$$

$$R_2 \leq \min_{\tilde{P}_{X_1 X_2 Y} \in \mathcal{T}_2(P_{X_1 X_2 Y})} I_{\tilde{P}}(X_2; X_1, Y). \quad (10)$$

Proof: See Section III. $\blacksquare$

The minimization in (9) is a non-convex optimization problem, but it can be cast in terms of convex optimization problems; see the Appendix for details. While our focus is on achievable rates, the proof of Theorem 1 reveals that the error exponent corresponding to (10) coincides with one of the three error events for maximum-metric decoding [5], and the error exponent corresponding to (9) is given by

$$\begin{aligned} \min_{P_{X_1 X_2 Y} : P_{X_1} = Q_1, P_{X_2} = Q_2} D(P_{X_1 X_2 Y} \| Q_1 \times Q_2 \times W) \\ + [I_0(P_{X_1 X_2 Y}, R_2) - R_1]^+, \end{aligned} \quad (11)$$

where $I_0(P_{X_1 X_2 Y}, R_2)$ denotes the right-hand side of (9) with an arbitrary distribution $P_{X_1 X_2 Y}$ used in (5)–(8) (rather than $P_{X_1 X_2 Y} = Q_1 \times Q_2 \times W$).

Figure 1. Achievable rate regions for the channel given in (12).

A. Numerical Example

We consider the MAC with $\mathcal{X}_1 = \mathcal{X}_2 = \{0, 1\}$, $\mathcal{Y} = \{0, 1, 2\}$, and

$$W(y|x_1, x_2) = \begin{cases} 1 - 2\eta_{x_1 x_2} & y = x_1 + x_2 \\ \eta_{x_1 x_2} & \text{otherwise,} \end{cases} \quad (12)$$

where $\{\eta_{x_1 x_2}\}$ are constants. The mismatched decoder uses $q(x_1, x_2, y)$ of a similar form, but a fixed value η in place of $\{\eta_{x_1 x_2}\}$. We set $\eta_{00} = 0.01$, $\eta_{01} = 0.1$, $\eta_{10} = 0.01$, $\eta_{11} = 0.3$, $\eta = 0.15$, and $Q_1 = Q_2 = (0.5, 0.5)$. Figure 1 plots the achievable rates regions of successive decoding (Theorem 1), maximum-metric decoding (see [3], [5]), and matched decoding (yielding the same region whether successive or maximum-metric).

Interestingly, neither of the mismatched rate regions dominates the other, thus suggesting that the two decoding rules are fundamentally different. For the given input distribution, the sum rate for successive decoding exceeds that of maximum-metric decoding. Furthermore, upon taking the convex hull (which is justified by a time sharing argument [3], [8]), the region for successive decoding is strictly larger. While we observed similar behaviors for other choices of Q_1 and Q_2 , it remains unclear as to whether this always holds. Furthermore, while the rate region for maximum-metric decoding is tight with respect to the ensemble average [3], it is unclear whether the same is true for that of successive decoding.

The vertical line at $R_1 \approx 0.1$ is analogous to the interference channel, where for R_1 below a certain threshold, R_2 can take any value while still ensuring user 1's message is estimated correctly [6]. Due to the mismatch, this induces a non-pentagonal shape in the present example.

III. PROOF OF THEOREM 1

Our analysis is based on the method of type class enumeration (e.g. see [6], [9], [10]), and is perhaps most similar to that of Somekh-Baruch and Merhav [10]. We consider constant-composition random coding, where for $\nu = 1, 2$ we have

$$P_{\mathbf{X}_\nu}(\mathbf{x}_\nu) = \frac{1}{|T^n(Q_\nu)|} \mathbb{1}\{\mathbf{x}_\nu \in T^n(Q_\nu)\}. \quad (13)$$

Here we assume that Q_1 and Q_2 are types for notational convenience; more generally, we can approximate these by types and the analysis is unchanged. The (independent) random codewords are denoted by $(\mathbf{X}_\nu^{(1)}, \dots, \mathbf{X}_\nu^{(M_\nu)})$. We assume without loss of generality that $m_1 = m_2 = 1$, and we write $\mathbf{X}_\nu = \mathbf{X}_\nu^{(1)}$ and let $\bar{\mathbf{X}}_\nu$ denote an arbitrary $\mathbf{X}_\nu^{(j)}$ with $j \neq 1$. The output sequence is denoted by $\mathbf{Y}$, and we write $R_\nu \triangleq \frac{1}{n} \log M_\nu$ ($\nu = 1, 2$).

As noted by Grant *et al.* [11], we can analyze the error probability of the second decoding step (see (3)) assuming that no error occurred on the first step (see (2)), while still using the unconditional statistics of $(\mathbf{X}_1, \mathbf{X}_2, \mathbf{Y})$. The subsequent analysis has been done in the study of maximum-metric decoding [3], [5], and the corresponding rate condition is precisely (10). In the remainder of this section, we focus on the first decoding step.

Let $\bar{p}_{e,1}(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y})$ denote the random-coding error probability for the first decoding step conditioned on $(\mathbf{X}_1^{(1)}, \mathbf{X}_2^{(1)}, \mathbf{Y}) = (\mathbf{x}_1, \mathbf{x}_2, \mathbf{y})$. The joint type of $(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y})$ is denoted by $P_{X_1 X_2 Y}$.¹ We write the objective in (2) as

$$\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{\mathbf{x}}_1) \triangleq q^n(\bar{\mathbf{x}}_1, \mathbf{x}_2, \mathbf{y}) + \sum_{j \neq 1} q^n(\bar{\mathbf{x}}_1, \mathbf{X}_2^{(j)}, \mathbf{y}), \quad (14)$$

which is random due to the randomness of $\{\mathbf{X}_2^{(j)}\}$. Using the union bound, we have

$$\bar{p}_{e,1}(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y}) \leq (M_1 - 1) \mathbb{P}[\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{\mathbf{X}}_1) \geq \Xi_{\mathbf{x}_2 \mathbf{y}}(\mathbf{x}_1)]. \quad (15)$$

We proceed by analyzing the statistics of $\Xi_{\mathbf{x}_2 \mathbf{y}}$. From (14),

$$\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{\mathbf{x}}_1) = q^n(\tilde{P}_{X_1 X_2 Y}) + \sum_{\tilde{P}'_{X_1 X_2 Y}} N_{\bar{\mathbf{x}}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) q^n(\tilde{P}'_{X_1 X_2 Y}), \quad (16)$$

where $\tilde{P}_{X_1 X_2 Y}$ is the joint type of $(\bar{\mathbf{x}}_1, \mathbf{x}_2, \mathbf{y})$, $N_{\bar{\mathbf{x}}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y})$ is the random number of $\mathbf{X}_2^{(j)}$ ($j \neq 1$) such that $(\bar{\mathbf{x}}_1, \mathbf{X}_2^{(j)}, \mathbf{y}) \in T^n(\tilde{P}'_{X_1 X_2 Y})$, and we write $q^n(\tilde{P}'_{X_1 X_2 Y}) \triangleq q^n(\bar{\mathbf{x}}_1, \bar{\mathbf{x}}_2, \mathbf{y})$ for an arbitrary triplet $(\bar{\mathbf{x}}_1, \bar{\mathbf{x}}_2, \mathbf{y}) \in T^n(\tilde{P}'_{X_1 X_2 Y})$. Since the codewords are generated independently, $N_{\bar{\mathbf{x}}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y})$ is binomially distributed with $M_2 - 1$ trials and success probability $\mathbb{P}[(\bar{\mathbf{x}}_1, \bar{\mathbf{X}}_2, \mathbf{y}) \in T^n(\tilde{P}'_{X_1 X_2 Y})]$. By construction, we have $N_{\bar{\mathbf{x}}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) = 0$ unless $\tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y})$, where

$$\mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y}) \triangleq \left\{ \tilde{P}'_{X_1 X_2 Y} : \tilde{P}'_{X_1 Y} = \tilde{P}_{X_1 Y}, \tilde{P}'_{X_2} = Q_2 \right\}. \quad (17)$$

The following lemma characterizes the behavior of $N_{\bar{\mathbf{x}}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y})$ for fixed R_2 and $\tilde{P}'_{X_1 X_2 Y}$. The proof can be found in [6], [10], and is based on the fact that

$$\mathbb{P}[(\bar{\mathbf{x}}_1, \bar{\mathbf{X}}_2, \mathbf{y}) \in T^n(\tilde{P}'_{X_1 X_2 Y})] \doteq e^{-n I_{\tilde{P}'}(X_2; X_1, Y)}. \quad (18)$$

Roughly speaking, the lemma states that if $R_2 > I_{\tilde{P}'}(X_2; X_1, Y)$ then the corresponding type enumerator is highly concentrated about its mean, whereas if $R_2 <$

$I_{\tilde{P}'}(X_2; X_1, Y)$ then the type enumerator takes a subexponential value (possibly zero) with overwhelming probability.

Lemma 1. [6], [10] *Fix the pair $(\bar{\mathbf{x}}_1, \mathbf{y}) \in T^n(\tilde{P}_{X_1 Y})$, a constant $\delta > 0$, and a type $\tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y})$.*

(i) *If $R_2 \geq I_{\tilde{P}'}(X_2; X_1, Y) + \delta$, then*

$$M_2 e^{-n(I_{\tilde{P}'}(X_2; X_1, Y) + \delta)} \leq N_{\bar{\mathbf{x}}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) \quad (19)$$

$$\leq M_2 e^{-n(I_{\tilde{P}'}(X_2; X_1, Y) - \delta)} \quad (20)$$

with probability approaching one super-exponentially fast.

(ii) *If $R_2 < I_{\tilde{P}'}(X_2; X_1, Y) + \delta$, then*

$$N_{\bar{\mathbf{x}}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) \leq e^{-n 2\delta} \quad (21)$$

with probability approaching one super-exponentially fast.

Given a joint type $\tilde{P}_{X_1 X_2 Y}$, let $\mathcal{A}_\delta(\tilde{P}_{X_1 X_2 Y})$ denote the event that the high-probability events in Lemma 1 occur for all $\tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y})$. Since $\mathbb{P}[\mathcal{A}_\delta(\tilde{P}_{X_1 X_2 Y})] \rightarrow 1$ super-exponentially fast, we can safely condition any event on $\mathcal{A}_\delta(\tilde{P}_{X_1 X_2 Y})$ without changing the exponential behavior of the corresponding probability.

Conditioned on $\mathcal{A}_\delta(P_{X_1 X_2 Y})$, we have the following:

$$\begin{aligned} \Xi_{\mathbf{x}_2 \mathbf{y}}(\mathbf{x}_1) &= q^n(P_{X_1 X_2 Y}) + \sum_{P'_{X_1 X_2 Y}} N_{\mathbf{x}_1 \mathbf{y}}(P'_{X_1 X_2 Y}) q^n(P'_{X_1 X_2 Y}) \\ &\geq q^n(P_{X_1 X_2 Y}) \end{aligned} \quad (22)$$

$$\begin{aligned} &+ \max_{\substack{P'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, P_{X_1 Y}) \\ R_2 \geq I_{P'}(X_2; X_1, Y) + \delta}} N_{\mathbf{x}_1 \mathbf{y}}(P'_{X_1 X_2 Y}) q^n(P'_{X_1 X_2 Y}) \\ &\geq q^n(P_{X_1 X_2 Y}) \\ &+ \max_{\substack{P'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, P_{X_1 Y}) \\ R_2 \geq I_{P'}(X_2; X_1, Y) + \delta}} M_2 e^{-n(I_{P'}(X_2; X_1, Y) + \delta)} q^n(P'_{X_1 X_2 Y}) \\ &\triangleq \underline{F}_\delta(P_{X_1 X_2 Y}), \end{aligned} \quad (24)$$

$$\triangleq \underline{F}_\delta(P_{X_1 X_2 Y}), \quad (25)$$

where (24) follows from part (i) of Lemma 1. Unlike $\Xi_{\mathbf{x}_2 \mathbf{y}}(\mathbf{x}_1)$, the quantity $\underline{F}_\delta(P_{X_1 X_2 Y})$ is deterministic. Substituting (25) into (15), we obtain

$$\bar{p}_{e,1}(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y}) \leq M_1 \mathbb{P}[\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{\mathbf{X}}_1) \geq \underline{F}_\delta(P_{X_1 X_2 Y})]. \quad (26)$$

Since the statistics of $\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{\mathbf{x}}_1)$ depend on $\bar{\mathbf{x}}_1$ only through the joint type of $(\bar{\mathbf{x}}_1, \mathbf{x}_2, \mathbf{y})$, we can write (26) as follows:

$$\begin{aligned} \bar{p}_{e,1}(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y}) &\leq M_1 \sum_{\tilde{P}_{X_1 X_2 Y}} \mathbb{P}[(\bar{\mathbf{X}}_1, \mathbf{x}_2, \mathbf{y}) \in T^n(\tilde{P}_{X_1 X_2 Y})] \\ &\quad \times \mathbb{P}[\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{\mathbf{x}}_1) \geq \underline{F}_\delta(P_{X_1 X_2 Y})] \end{aligned} \quad (27)$$

$$\begin{aligned} &\doteq M_1 \max_{\tilde{P}_{X_1 X_2 Y} \in \mathcal{S}_1(Q_1, P_{X_2 Y})} e^{-n I_{\tilde{P}}(X_1; X_2, Y)} \\ &\quad \times \mathbb{P}[\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{\mathbf{x}}_1) \geq \underline{F}_\delta(P_{X_1 X_2 Y})], \end{aligned} \quad (28)$$

¹This is a slight abuse of notation in light of the previous definition $P_{X_1 X_2 Y} = Q_1 \times Q_2 \times W$, but this substitution will be made later.

where $\bar{x}_1$ denotes an arbitrary sequence such that $(\bar{x}_1, \mathbf{x}_2, \mathbf{y}) \in T^n(\tilde{P}_{X_1 X_2 Y})$, and

$$\mathcal{S}_1(Q_1, P_{X_2 Y}) \triangleq \left\{ \tilde{P}_{X_1 X_2 Y} : \tilde{P}_{X_1} = Q_1, \tilde{P}_{X_2 Y} = P_{X_2 Y} \right\}. \quad (29)$$

In (28), we have used an analogous property to (18).

Next, we again use Lemma 1 in order to replace $\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{x}_1)$ in (28) by a deterministic quantity. We have from (16) that

$$\Xi_{\mathbf{x}_2 \mathbf{y}}(\bar{x}_1) \leq q^n(\tilde{P}_{X_1 X_2 Y}) + p_0(n) \max_{\tilde{P}'_{X_1 X_2 Y}} N_{\bar{x}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) q^n(\tilde{P}'_{X_1 X_2 Y}), \quad (30)$$

where $p_0(n)$ is a polynomial corresponding to the total number of joint types. Substituting (30) into (28), we obtain

$$\bar{p}_{e,1}(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y}) \leq M_1 \max_{\tilde{P}_{X_1 X_2 Y} \in \mathcal{S}_1(Q_1, P_{X_2 Y})} \max_{\tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y})} e^{-nI_{\tilde{P}}(X_1; X_2, Y)} \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y})], \quad (31)$$

where

$$\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y}) \triangleq \left\{ q^n(\tilde{P}_{X_1 X_2 Y}) + p_0(n) N_{\bar{x}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) q^n(\tilde{P}'_{X_1 X_2 Y}) \geq \underline{F}_\delta(P_{X_1 X_2 Y}) \right\}, \quad (32)$$

and we have used the union bound to take the maximum over $\tilde{P}'_{X_1 X_2 Y}$ outside the probability in (31). Continuing, we have

$$\begin{aligned} & \max_{\tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y})} \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y})] \\ &= \max \left\{ \max_{\substack{\tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y}) \\ R_2 \geq I_{\tilde{P}'}(X_2; X_1, Y) + \delta}} \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y})], \right. \\ & \quad \left. \max_{\substack{\tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y}) \\ R_2 < I_{\tilde{P}'}(X_2; X_1, Y) + \delta}} \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y})] \right\}. \quad (33) \end{aligned}$$

For the first maximization in (33), observe that conditioned on $\mathcal{A}_\delta(\tilde{P}_{X_1 X_2 Y})$ (defined following Lemma 1), we have for $\tilde{P}'_{X_1 X_2 Y}$ satisfying $R_2 \geq I_{\tilde{P}'}(X_2; X_1, Y) + \delta$ that

$$\begin{aligned} & N_{\bar{x}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) q^n(\tilde{P}'_{X_1 X_2 Y}) \\ & \leq M_2 e^{-n(I_{\tilde{P}'}(X_2; X_1, Y) - \delta)} q^n(\tilde{P}'_{X_1 X_2 Y}). \quad (34) \end{aligned}$$

Hence, and using Lemma 1, we have

$$\begin{aligned} & \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y})] \leq \mathbb{1} \left\{ q^n(\tilde{P}_{X_1 X_2 Y}) \right. \\ & \left. + M_2 p_0(n) e^{-n(I_{\tilde{P}'}(X_2; X_1, Y) - \delta)} q^n(\tilde{P}'_{X_1 X_2 Y}) \geq \underline{F}_\delta(P_{X_1 X_2 Y}) \right\}. \quad (35) \end{aligned}$$

For the second maximization in (33), we define the event $\mathcal{B} \triangleq \{N_{\bar{x}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) > 0\}$, yielding

$$\mathbb{P}[\mathcal{B}] \leq M_2 e^{-nI_{\tilde{P}'}(X_2; X_1, Y)}, \quad (36)$$

which follows from the union bound and the identity in (18). Whenever $R_2 < I_{\tilde{P}'}(X_2; X_1, Y) + \delta$, we have

$$\begin{aligned} & \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y})] \\ & \leq \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y}) \mid \mathcal{B}^c] + \mathbb{P}[\mathcal{B}] \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y}) \mid \mathcal{B}] \quad (37) \end{aligned}$$

$$\begin{aligned} & \leq \mathbb{1} \left\{ q^n(\tilde{P}_{X_1 X_2 Y}) \geq \underline{F}_\delta(P_{X_1 X_2 Y}) \right\} \\ & \quad + M_2 e^{-nI_{\tilde{P}'}(X_2; X_1, Y)} \mathbb{P}[\mathcal{E}_{P, \tilde{P}}(\tilde{P}'_{X_1 X_2 Y}) \mid \mathcal{B}], \quad (38) \end{aligned}$$

$$\begin{aligned} & \leq \mathbb{1} \left\{ q^n(\tilde{P}_{X_1 X_2 Y}) \geq \underline{F}_\delta(P_{X_1 X_2 Y}) \right\} + M_2 e^{-nI_{\tilde{P}'}(X_2; X_1, Y)} \\ & \quad \times \mathbb{1} \left\{ q^n(\tilde{P}_{X_1 X_2 Y}) + p_0(n) e^{-n2\delta} q^n(\tilde{P}'_{X_1 X_2 Y}) \geq \underline{F}_\delta(P_{X_1 X_2 Y}) \right\}, \quad (39) \end{aligned}$$

where (38) follows from (36) and since $\mathcal{B}^c$ implies $N_{\bar{x}_1 \mathbf{y}}(\tilde{P}'_{X_1 X_2 Y}) = 0$, and (39) uses part (ii) of Lemma 1.

Observe that $\underline{F}(P_{X_1 X_2 Y}, R_2)$ in (5) is obtained from $\underline{F}_\delta$ in (25) in the limit as $\delta \rightarrow 0$. Similarly, the exponents corresponding to the other quantities appearing in the indicator functions in (35) and (39) tend toward the following:

$$\begin{aligned} & \bar{F}_1(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}, R_2) \triangleq \max \left\{ \mathbb{E}_{\tilde{P}}[\log q(X_1, X_2, Y)], \right. \\ & \quad \left. \mathbb{E}_{\tilde{P}'}[\log q(X_1, X_2, Y)] + R_2 - I_{\tilde{P}'}(X_2; X_1, Y) \right\} \quad (40) \end{aligned}$$

$$\begin{aligned} & \bar{F}_2(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \triangleq \max \left\{ \mathbb{E}_{\tilde{P}}[\log q(X_1, X_2, Y)], \right. \\ & \quad \left. \mathbb{E}_{\tilde{P}'}[\log q(X_1, X_2, Y)] \right\}. \quad (41) \end{aligned}$$

Combining (31), (33), (35) and (39) with these expressions, taking $\delta \rightarrow 0$, and using the continuity of the underlying terms in the optimizations, we obtain

$$\begin{aligned} & \bar{p}_{e,1}(\mathbf{x}_1, \mathbf{x}_2, \mathbf{y}) \leq \max \left\{ \right. \\ & \quad \max_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(1)}(P_{X_1 X_2 Y}, R_2)} M_1 e^{-nI_{\tilde{P}}(X_1; X_2, Y)}, \\ & \quad \max_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(2')}(P_{X_1 X_2 Y}, R_2)} M_1 e^{-nI_{\tilde{P}}(X_1; X_2, Y)}, \\ & \quad \max_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(2)}(P_{X_1 X_2 Y}, R_2)} M_1 e^{-nI_{\tilde{P}}(X_1; X_2, Y)} \\ & \quad \left. \times M_2 e^{-nI_{\tilde{P}'}(X_2; X_1, Y)} \right\}, \quad (42) \end{aligned}$$

where²

$$\begin{aligned} & \mathcal{T}_1^{(1)}(P_{X_1 X_2 Y}, R_2) \triangleq \\ & \quad \left\{ (\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) : \tilde{P}_{X_1 X_2 Y} \in \mathcal{S}_1(Q_1, P_{X_2 Y}), \right. \\ & \quad \tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y}), I_{\tilde{P}'}(X_2; X_1, Y) \leq R_2, \\ & \quad \left. \bar{F}_1(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}, R_2) \geq \underline{F}(P_{X_1 X_2 Y}, R_2) \right\} \quad (43) \end{aligned}$$

²Strictly speaking, these sets depend on (Q_1, Q_2) , but this dependence need not be explicit, since we have $P_{X_1} = Q_1$ and $P_{X_2} = Q_2$.

$$\begin{aligned} \mathcal{T}_1^{(2')} (P_{X_1 X_2 Y}, R_2) \triangleq & \left\{ (\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) : \right. \\ & \tilde{P}_{X_1 X_2 Y} \in \mathcal{S}_1(Q_1, P_{X_2 Y}), \tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y}), \\ & \left. \mathbb{E}_{\tilde{P}}[\log q(X_1, X_2, Y)] \geq \underline{F}(P_{X_1 X_2 Y}, R_2) \right\} \quad (44) \end{aligned}$$

$$\begin{aligned} \mathcal{T}_1^{(2)} (P_{X_1 X_2 Y}, R_2) \triangleq & \left\{ (\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) : \tilde{P}_{X_1 X_2 Y} \in \mathcal{S}_1(Q_1, P_{X_2 Y}), \right. \\ & \tilde{P}'_{X_1 X_2 Y} \in \mathcal{S}'_1(Q_2, \tilde{P}_{X_1 Y}), I_{\tilde{P}'}(X_2; X_1, Y) \geq R_2, \\ & \left. \bar{F}_2(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \geq \underline{F}(P_{X_1 X_2 Y}, R_2) \right\}. \quad (45) \end{aligned}$$

The three terms in the maximization in (42) respectively correspond to (35) and the two terms in (39).

Since $\bar{F}_1 \geq \mathbb{E}_{\tilde{P}}[\log q]$, we see that $\mathcal{T}_1^{(1)} \subseteq \mathcal{T}_1^{(2')}$, and hence the second term in the outer maximum of (42) can be removed. Furthermore, we can safely substitute $P_{X_1 X_2 Y} = Q_1 \times Q_2 \times W$, since $P_{X_1 X_2 Y} \rightarrow Q_1 \times Q_2 \times W$ with probability approaching one by the law of large numbers. We thus obtain the following rate conditions for the first decoding step:

$$R_1 \leq \min_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(1)}(P_{X_1 X_2 Y}, R_2)} I_{\tilde{P}}(X_1; X_2, Y) \quad (46)$$

$$\begin{aligned} R_1 + R_2 \leq & \min_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(2)}(P_{X_1 X_2 Y}, R_2)} \\ & I_{\tilde{P}}(X_1; X_2, Y) + I_{\tilde{P}'}(X_2; X_1, Y). \quad (47) \end{aligned}$$

Finally, using the definitions of $\bar{F}$, $\mathcal{S}_1$, $\mathcal{S}'_1$, $\mathcal{T}_1^{(1)}$ and $\mathcal{T}_1^{(2)}$ (see (4), (17), (29), (43) and (45)) to unite (46)–(47) yields (9).

APPENDIX

Here we write (9) in terms of convex optimization problems, starting with the alternative expression in (46)–(47). We first note that (47) holds if and only if

$$\begin{aligned} R_1 \leq & \min_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(2)}(P_{X_1 X_2 Y}, R_2)} I_{\tilde{P}}(X_1; X_2, Y) \\ & + [I_{\tilde{P}'}(X_2; X_1, Y) - R_2]^+, \quad (48) \end{aligned}$$

due to the constraint $I_{\tilde{P}'}(X_2; X_1, Y) \geq R_2$. Next, we claim that when combining (46) and (48), the rate region is unchanged if the constraint $I_{\tilde{P}'}(X_2; X_1, Y) \geq R_2$ is omitted from (48). To see this, note that for $I_{\tilde{P}'}(X_2; X_1, Y) < R_2$, the objective in (48) coincides with that of (46). The desired result follows from the identity $\bar{F}_1 > \bar{F}_2$ (using (40)–(41) and the assumption $I_{\tilde{P}'}(X_2; X_1, Y) < R_2$), implying that (46) is more restrictive.

We now deal with the non-concavity of $\bar{F}_1$ and $\bar{F}_2$. Using the identity

$$\min_{x \leq \max\{a, b\}} f(x) = \min \left\{ \min_{x \leq a} f(x), \min_{x \leq b} f(x) \right\}, \quad (49)$$

we obtain the following rate conditions from (46) and (48):

$$R_1 \leq \min_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(1,1)}(P_{X_1 X_2 Y}, R_2)} I_{\tilde{P}}(X_1; X_2, Y) \quad (50)$$

$$R_1 \leq \min_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(1,2)}(P_{X_1 X_2 Y}, R_2)} I_{\tilde{P}}(X_1; X_2, Y) \quad (51)$$

$$\begin{aligned} R_1 \leq & \min_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(2,1)}(P_{X_1 X_2 Y}, R_2)} I_{\tilde{P}}(X_1; X_2, Y) \\ & + [I_{\tilde{P}'}(X_2; X_1, Y) - R_2]^+ \quad (52) \end{aligned}$$

$$\begin{aligned} R_1 \leq & \min_{(\tilde{P}_{X_1 X_2 Y}, \tilde{P}'_{X_1 X_2 Y}) \in \mathcal{T}_1^{(2,2)}(P_{X_1 X_2 Y}, R_2)} I_{\tilde{P}}(X_1; X_2, Y) \\ & + [I_{\tilde{P}'}(X_2; X_1, Y) - R_2]^+, \quad (53) \end{aligned}$$

where for $k = 1, 2$ and $l = 1, 2$, $\mathcal{T}_1^{(k,l)}$ is defined in the same way as $\mathcal{T}_1^{(k)}$ with the following modifications: (i) The constraint $\bar{F}_k \geq \underline{F}$ is changed so that the left-hand side contains the l -th term in the maximization in $\bar{F}_k$ (see (40)–(41)); (ii) For $k = 2$, the constraint $I_{\tilde{P}'}(X_2; X_1, Y) \geq R_2$ is removed, in accordance with the discussion following (48).

The variable $\tilde{P}'_{X_1 X_2 Y}$ can be removed from both (50) and (52), since in both cases the choice $\tilde{P}'_{X_1 X_2 Y}(x_1, x_2, y) = P_{X_2}(x_2)\tilde{P}_{X_1 Y}(x_1, y)$ is feasible and yields an objective of $I_{\tilde{P}}(X_1; X_2, Y)$. It follows that (50) and (52) yield the same value, and we conclude that (9) can equivalently be expressed in terms of three conditions: (51), (53), and

$$R_1 \leq \min_{\tilde{P}_{X_1 X_2 Y} \in \mathcal{T}_1^{(1,1')}(P_{X_1 X_2 Y}, R_2)} I_{\tilde{P}}(X_1; X_2, Y), \quad (54)$$

where $\mathcal{T}_1^{(1,1')}$ is defined in the same way as $\mathcal{T}_1^{(1,1)}$ with the variable $\tilde{P}'_{X_1 X_2 Y}$ removed. These three conditions are all written as convex optimization problems, as desired.
